Case 1: linear
technology,
linear costs and
no externalities

Case 1-A: zero
fixed costs

Case 1-A with

- Real conflicts (wars, political, social, interpersonal) are characterized by
 - 1 sudden surge
 - 2 huge diversity in evolution through time and in outcomes.
- Why?
- Two possible explanations:
 - 1 structural change in the environment \Leftrightarrow comparative statics, which "*requires*" uniqueness of equilibria
 - 2 dynamics out of equilibrium \Leftrightarrow stability, which "*requires*" multiplicity of equilibria to be interesting

GENERAL PROBLEM: Why actual conflicts present so many different situations and evolution through time?

Can we provide an explanation of the two common characteristics of actual conflicts, i.e. that

- 1 very often they came as a surprise
- 2 their evolution through time is very heterogenous, sometimes they quickly disappear sometimes they degenerate in catastrophe

Case 1-A with

Definition

A Model of Political and Social Conflict is defined by the following element:

- 1 *two agents*, part 1 and 2, denoted by

$$i, j \in \{1, 2\};$$

- 2 the agents' *efforts*:

$$x_i \in X_i \subseteq \mathbb{R}^+, \quad i \in \{1, 2\};$$

- 3 the agents' *effectiveness of efforts*:

$$S_i(x_i, x_j) : X_i \times X_j \rightarrow \mathbb{R}^+, \quad i \in \{1, 2\};$$

Definition

4. the agents' *goals*:

$$g_i : X_i \times X_j \rightarrow [\underline{g}_i, \overline{g}_i] \subseteq \mathbb{R}, \quad i \in \{1, 2\};$$

$$\theta(x_i, x_j) := g_2(x_2, x_1) - g_1(x_1, x_2) > 0$$

is a measure of social and political *polarization*;

5. the *outcome function* describes the result of the conflict as a function of both agents' efforts' effectiveness

$$\zeta : \mathbb{R}^+ \times \mathbb{R}^+ \rightarrow [g_1, g_2];$$

as ζ is near g_2 , we have that 2 is prevailing, while if ζ is near g_1 it states the superiority of 1;

Technology

Specific Cases
of Models of
Political and
Social Conflict

Case 1: linear
technology,
linear costs and
no externalities

Case 1-A: zero
fixed costs

Case 1-A with

Remark

- 1 *If the set of possible player's effort X_i is bounded, then wlg we can normalize the intensity of the effort $x_i \in [0, 1]$.*
- 2 *If we assume that the agents' goals g_i do not depend on the players' efforts, then we put our model within the class of rent seeking models, while in the models of production and conflict the value of the goals is endogenously determined by the agents' choices*
- 3 *the separation between utility and cost functions is a common restriction in the literature of economics of information.*

The Model - 4

Equilibria and
Stability in A

Restrictions
on Utilities
and Conflict
Technology

Specific Cases
of Models of
Political and
Social Conflict

Case 1: linear
technology,
linear costs and
no externalities

Case 1-A: zero
fixed costs

Case 1-A with

Consider the standard definition of Contest, e.g. Corchon 2007:

Definition

A Contest is defined by the following element:

- 1 A finite set of *agents*, the contenders:

$$N = \{1, \dots, n\};$$

- 2 A set of possible *actions* taken by the agents before a prize is allocated:

$$a_i \in A_i \quad \forall i \in N;$$

- 3 A *prize* that may depend on agents' actions:

$$V_i : A_1 \times \dots \times A_n \rightarrow \mathbb{R} \quad \forall i \in N;$$

let denote the set of *i*'s possible prizes as Ω_i ;

Definition

4. A *contest success function* relating agents' actions to the probability of obtaining the prize:

$$p_i : A_1 \times \dots \times A_n \rightarrow \Delta(\Omega_i) \quad \forall i \in N;$$

5. A *utility function* evaluating each agent prize:

$$U_i : \Omega_i \rightarrow \mathbb{R} \quad \forall i \in N;$$

6. A *cost function* relating agents' actions to the cost of the actions:

$$C_i : A_1 \times \dots \times A_n \rightarrow \mathbb{R} \quad \forall i \in N.$$

Remark

It is immediate to see that a Model of Political and Social Conflict is a particular specific Contest.

Remark

A peculiar difference between contests and MPSC is that in our model outcomes and conflict technology are objective, while subjectivity, i.e. agents' dependence, regard the effectiveness of effort and the preferences, a characteristic that we believe better match real conflicts, helping interpretation and understanding.

Agents' Utilities

Technology

Specific Cases
of Models of
Political and
Social Conflict

Case 1: linear
technology,
linear costs and
no externalities

Case 1-A: zero
fixed costs

Case 1-A with

Hypothesis

The agents' utility function is linearly decreasing in the distance d_i between its goal and the outcome:

$$d_1(x_1, x_2) = \zeta(S_i(x_i, x_j), S_j(x_j, x_i)) - g_1(x_1, x_2),$$

$$d_2(x_2, x_1) = g_2(x_2, x_1) - \zeta(S_i(x_i, x_j), S_j(x_j, x_i))$$

Then wlg we normalize the linear utility function, so that

$$U_i(x_i, x_j) = -d_i(x_i, x_j).$$

Remark

This functional form is useful to focus on the role of polarization.

Model of
Political and
Social
Conflict.

Fausto
Cavalli*,
Mario Gilli*
and Ahmad
Naimzada*

The Model of
Political and
Social Conflict

Restrictions
on Utilities
and Conflict
Technology

Specific Cases
of Models of
Political and
Social Conflict

Case 1: linear
technology,
linear costs and
no externalities

Case 1-A: zero
fixed costs

Case 1-A with

- In production theory cost functions are derived from technology and from a "reduced form" dynamics, i.e. the distinction between short and long run
- Fixed costs are a reduced form of the impact of past decisions on today decisions only if this past effects are redeemable
- Their application to conflict theory requires further considerations.

- In conflict's costs should be included not only the direct costs of exerting effort, including opportunity costs, but also this "reduced form" dynamics
- If we restrict ourself to direct conflict's costs, then all fixed costs are sunk, they can not be redeemed since usually there is no market for conflict's efforts
- Conflict's fixed costs might be used to model a "reduced form" of continuation payoff, which means that fixed costs might be negative when conflicting is seen as a way of establishing future positive reputation.

The reduced form of our MPSC

and Ahmad
Naimzada*

The Model of
Political and
Social Conflict

Restrictions
on Utilities
and Conflict
Technology

Specific Cases
of Models of
Political and
Social Conflict

Case 1: linear
technology,
linear costs and
no externalities

Case 1-A: zero
fixed costs

Case 1-A with

Proposition

Hypotheses 1 to 7 imply

$$\begin{aligned} E [\zeta (S_1 (x_1, x_2), S_2 (x_2, x_1))] &= \\ &= \frac{S_2 (x_2, x_1)}{S_1 (x_1, x_2) + S_2 (x_2, x_1)} \theta (x_1, x_2) + g_1 (x_1, x_2) = \\ &= - \frac{S_1 (x_1, x_2)}{S_1 (x_1, x_2) + S_2 (x_2, x_1)} \theta (x_1, x_2) + g_2 (x_2, x_1), \end{aligned}$$

hence

$$\pi_i (x_i, x_j) = - \frac{S_j (x_j, x_i)}{S_1 (x_1, x_2) + S_2 (x_2, x_2)} \theta (x_1, x_2) - C_i (x_i, x_j).$$

Technology

Specific Cases
of Models of
Political and
Social Conflict

Case 1: linear
technology,
linear costs and
no externalities

Case 1-A: zero
fixed costs

Case 1-A with

Remark

Hence, under these assumptions, a MPSC is equivalent to a contest where

- 1 **the contest success function is**

$$\frac{S_j(x_j, x_i)}{S_1(x_1, x_2) + S_2(x_2, x_1)}$$

- 2 **the prize is**

$$-\theta(x_1, x_2)$$

which means that from the point of view of the contest theory we are dealing with a very peculiar setting. In particular, note that our contest success function is different from the general technology used by Szidarovszky and Okuguchi 1997 which might look very similar.

When conflict technologies and costs functions are linear without externalities and there are fixed costs, then

- 1 *when the fixed costs are small, i.e.*

$K \in \left[0, \frac{\beta\theta^2}{\beta\theta+4c} + \frac{c}{\beta} - \frac{3}{4}\theta \right]$, then they are negligible and we get the equilibria of case 1-A;

- 2 *when the fixed costs are intermediate, i.e.*

$K \in \left[\frac{\beta\theta^2}{\beta\theta+4c} + \frac{c}{\beta} - \frac{3}{4}\theta, Z(\beta, \theta, c) \right]$, then there is no pure strategy equilibrium, hence the outcomes are random;

- 3 *when the fixed costs are huge, i.e. $K \in [Z(\beta, \theta, c), \infty)$, then in equilibrium there is no conflict;*

- 4 *when the fixed costs are negative, then in equilibrium either they are irrelevant or they induce maximum conflict*

Case 1: linear technology, linear costs and no externalities

Case 1-A: zero fixed costs

Case 1-A with

Proposition

When conflict technologies and costs functions are linear without externalities and there are fixed costs, then all the possible pure strategy equilibria are fully stable wrt to the best reply dynamics, independently of K, β, c, θ .

However, in the case of non existence of pure strategy equilibria there exists synchronous cycles of period three and asynchronous cycles of period six.

Restrictions
on Utilities
and Conflict
Technology

Specific Cases
of Models of
Political and
Social Conflict

Case 1: linear
technology,
linear costs and
no externalities

Case 1-A: zero
fixed costs

Case 1-A with

Proposition

When conflict technologies and costs functions are linear with externalities and there are no fixed costs, then there exists a unique symmetric pure strategy Nash equilibrium such that

$$\left(x_1^{NE}, x_2^{NE} \right) = \begin{cases} (0, 0) & \frac{\beta}{4c} \in \left[0, \frac{1}{\theta} \right], \alpha \in [0, \dots] \\ (x^*, x^*) \in (0, 1) \times (0, 1) & \text{otherwise} \\ (1, 1) & \alpha \in \left[\frac{1}{2}, 1 \right] \end{cases}$$

This proposition shows that from a qualitative point of view, the externalities on the conflict technology matters only if the externality parameter is big enough, i.e. $\alpha \in \left[\frac{1}{2}, 1 \right]$.

Comparative statics in case 2 with zero fixed costs

Proposition

When conflict technologies and costs functions are linear with externalities and there are no fixed costs, then

- 1 an increment in the marginal cost of conflicts c reduces the intensity of conflict in equilibrium;*
- 2 an increase of the marginal productivity of the effort β on its effectivity increases the intensity of conflict in equilibrium;*
- 3 an increase in polarization θ increases the intensity of conflict in equilibrium;*
- 4 an increase in α , increases the likelihood of getting an equilibrium with maximum conflict intensity.*

Evolution of conflict in case 2 with zero fixed costs

Case 1-A: zero
fixed costs

Case 1-A with

Proposition

When conflict technologies and costs functions are linear with externalities and there are no fixed costs, then the possible equilibria are fully stable with respect to the best reply dynamics, independently of α, β, c, θ .

The Equilibrium in case 2 with fixed costs

Equilibria and Stability in A Model of Political and Social Conflict.

Fausto Cavalli*,
Mario Gilli*
and Ahmad Naimzada*

The Model of Political and Social Conflict

Restrictions on Utilities and Conflict Technology

Specific Cases of Models of Political and Social Conflict

Case 1: linear technology, linear costs and no externalities

Case 1-A: zero fixed costs

Case 1-A with

Proposition

When conflict technologies and costs functions are linear with externalities and there are fixed costs, then the set of pure strategy Nash equilibria might be empty; when it is not empty then:

$$\left(x_1^{NE}(K), x_2^{NE}(K) \right) = \begin{cases} (0, 0) & K \text{ big enough} \\ (x_1^{NE}, x_2^{NE}) & K \text{ intermediate} \\ (x_1^{NE}, x_2^{NE}) \ \& \ (1, 1) & K \text{ negative} \end{cases} \quad \forall x_j \geq \frac{1}{2\alpha}$$

Hence, the evolution of conflict in case 2-B with negative fixed costs is interesting.

no externalities

Case 1-A: zero
fixed costs

Case 1-A with

- 1 Existence, uniqueness and stability are robust to the specification of the conflict technology and of the costs functions without fixed costs

hence in this case

- the interpretation of the stylized facts relies on comparative statics i.e. on the transition from an equilibrium to another as changes in
 - marginal productivity of effort
 - marginal cost of effort
 - **polarization**
- interpretation of stylized facts as a consequence of **structural changes.**

The Interpretation of Previous Results - 2

fixed costs

Case 1-A with

2. Non existence, multiplicity and interesting dynamics requires the specification of peculiar fixed costs functions

hence

- the interpretation of the stylized facts as dynamic transitions from a region to another relies on the role of costs functions even with slightly complex conflict technologies.

Case 1-A: zero
fixed costs

Case 1-A with

- Our results are partially disappointing since we would prefer to interpret the stylized facts in terms of dynamic transitions
- however
- the model stress the relevance of costs functions in conflict models
- and
- provides a general framework to discuss stylized facts.
- Our future work will focus on asymmetries.
